Solution

a

b

Exercise 8.1(Q no.51)

O is a point in the interior of $\triangle ABC$. D is a point on OA. If $DE \parallel OB$ and $DF \parallel OC$. Show that $EF \parallel BC$.

Construction methods

Construction methods

Construction methods

Solution

The python code for the figure is

```
./codes/similartriangle.py
```

The latex- tikz code is

```
./figs/constructionpic.tex
```

The above latex code can be compiled as standalone document

```
./figs/constructionpic_standalone.tex
```

Solution

a
b

The values used for constructing the triangles in both Python and \LaTeX -Tikz is given below:

Initial Input Values	
Parameter	Value
a	5
b	6
c	4

Table: To construct $\triangle ABC$

Finding the coordinates of various points of $\triangle ABC$:

From the information provided, let

$$B = \begin{pmatrix} 0 \\ 0 \end{pmatrix} \quad C = \begin{pmatrix} a \\ 0 \end{pmatrix} \quad A = \begin{pmatrix} p \\ q \end{pmatrix}$$

Given a point O , we need to determine whether it lies inside $\triangle ABC$.

The cross product $AB \times AO$ is defined as a vector n that is perpendicular (orthogonal) to both AB and AO , with a direction given by the right-hand rule.

A point O is said to lie inside $\triangle ABC$ if and only if all of the cross products $AB \times AO$, $BC \times BO$ and $CA \times CO$ point in the same direction relative to the plane. That is, either all of them point out of the plane, or all of them point into the plane.

Solution

a
b

The necessary criteria to satisfy this condition is $AB \times AO$, $BC \times BO$ and $CA \times CO$ must be ≥ 0 . Let the arbitrary interior point O be represented as $\begin{pmatrix} 2 \\ 1.5 \end{pmatrix}$.

D is a point on line AO such that $DE \parallel OB$ and $DF \parallel OC$.

Determination of points D, E and F:

As $DE \parallel OB$, by basic proportionality theorem the points E and D, divide the lines AB and AO respectively in the same ratio.

Hence we choose points E and D such that

$$\frac{AE}{EB} = \frac{AD}{DO} \quad (1)$$

Similarly point F is chosen such that the points F and D, divide the lines AC and AO respectively in the same ratio such that

$$\frac{AF}{FC} = \frac{AD}{DO} \quad (2)$$

Solution

a
b

If the point D divides the line AO in the ratio $x:y$, the coordinates of D is given by section formula as:

$$D = \frac{yA + xO}{x + y} \quad (3)$$

Similarly the coordinates of points E and F is given by

$$E = \frac{yA + xB}{x + y} \quad (4)$$

$$F = \frac{yA + xC}{x + y} \quad (5)$$

Let us assume the points divide the respective lines in the ratio 1:1. Then the coordinates of points D, E and F is

$$D = \begin{pmatrix} 1.25 \\ 2.73 \end{pmatrix} \quad E = \begin{pmatrix} 0.25 \\ 1.98 \end{pmatrix}$$

$$F = \begin{pmatrix} 2.75 \\ 1.98 \end{pmatrix}$$

To check whether D lies on line AO, substituting the values of the x and y co-ordinate of D must satisfy the equation of line AO. Equation of line joining two points (x_1, y_1) and (x_2, y_2) is given by

$$\frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} \quad (6)$$

Solution

$\triangle EAD \sim \triangle BAO$ by AAA Similarity:

Since $DE \parallel OB$,

① $\angle DEA = \angle OBA$ {Alternate Interior Angles}

② $\angle ADE = \angle AOB$ {Alternate Interior Angles}

③ $\angle EAD = \angle BAO$ {Common angle}

Therefore

$$\frac{AE}{AB} = \frac{AD}{AO} \quad (7)$$

Construction
methods

Construction
methods

Solution

a
b

Similarly $\triangle FDA \sim \triangle COA$ by AAA Similarity:

Since $DF \parallel OC$,

- ① $\angle DFA = \angle OCA$ { *Alternate Interior Angles*}
- ② $\angle ADF = \angle AOC$ { *Alternate Interior Angles*}
- ③ $\angle FAD = \angle CAO$ { *Common angle*}

Therefore

$$\frac{AF}{AC} = \frac{AD}{AO} \quad (8)$$

Hence from the above we conclude,

$$\frac{AF}{AC} = \frac{AE}{AB} = \frac{AD}{AO} \quad (9)$$

As the ratio of the sides is the same, $\triangle ABC \sim \triangle AEF$, which means $\angle AFE = \angle ACB$ and $\angle AEF = \angle ABC$ as similar triangles have same angles. i.e.

$$EF \parallel QR \quad (10)$$

Hence Proved.
